

Urban Drainage Modeling for Storm Water Design

Using QL2 LIDAR

Benjamin H. Houston
P.E., PMP, GISP

Karen Kwasnowski

What is QL2 LiDAR?

Table 1. Aggregate nominal pulse spacing and density, Quality Level 0–Quality Level 3.

[m, meters; pls/m², pulses per square meter; ≤, less than or equal to; ≥, greater than or equal to]

Quality Level (QL)	Aggregate nominal pulse spacing (ANPS) (m)	Aggregate nominal pulse density (ANPD) (pls/m ²)
QL0	≤0.35	≥8.0
QL1	≤0.35	≥8.0
QL2	≤0.71	≥2.0
QL3	≤1.41	≥0.5

So What's the Big Deal?

- ▶ MS4 Permit Compliance
- ▶ Infrastructure design
- ▶ Flood response
- ▶ Catchment Characteristics

Infiltration islands in a parking lot in San Mateo, California, help reduce runoff.

water.epa.gov

Use **LIDAR** based elevation data to:

- ▶ Show the drainage network - where runoff flows over land.
- ▶ Develop drainage catchments
- ▶ Derive metrics
- ▶ Model flow

Significant Value Proposition

- ▶ Currently a very slow, labor intensive process.
- ▶ Estimate: ~30 Years to complete with traditional survey approach

Workflow- Surface Prep

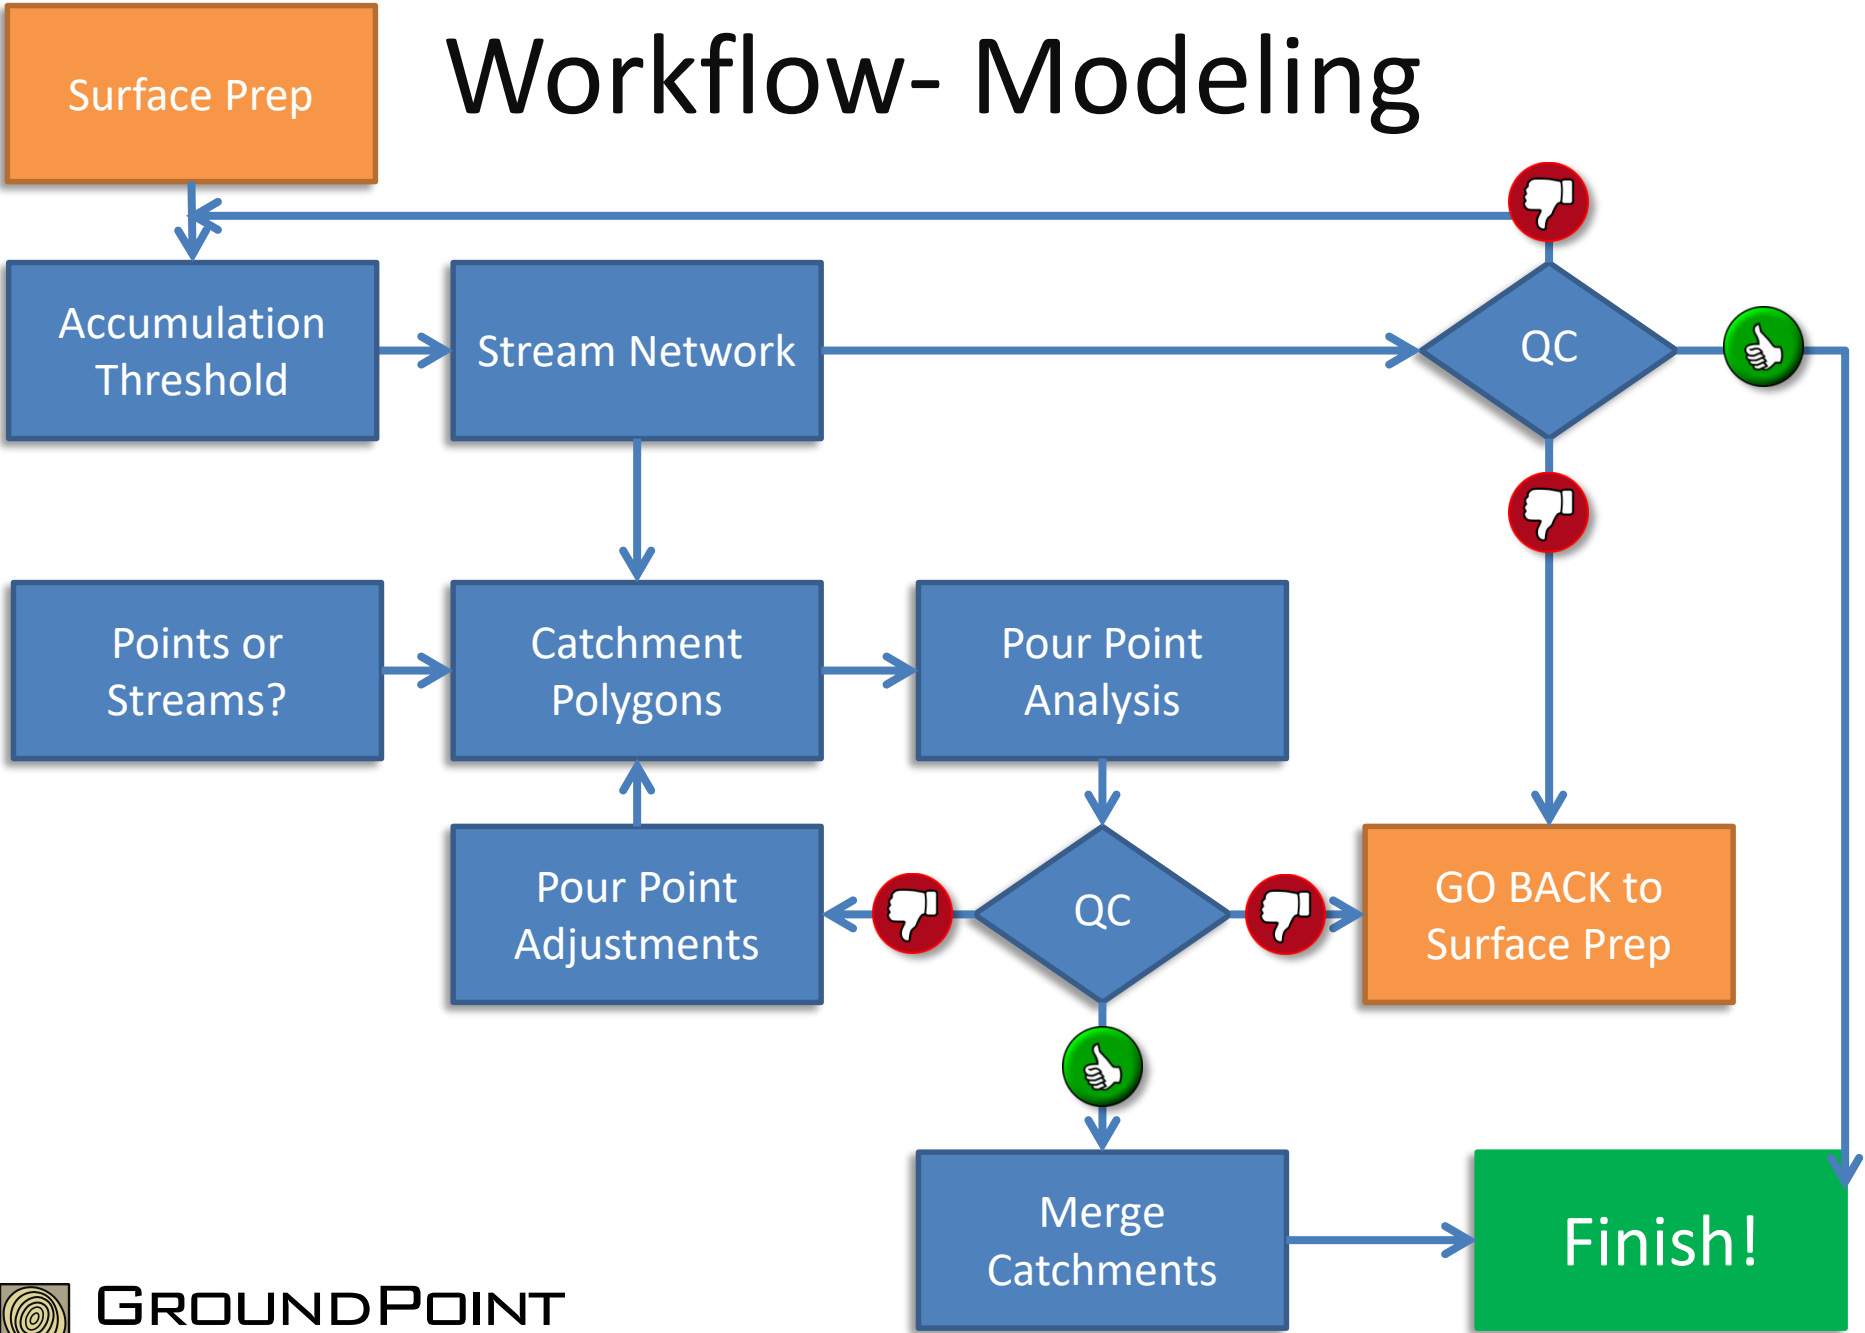

Original and Modified DEM are Exported from LP360.
LP360 tasks include re-classifying points and adding
Breaklines.

Unexpected Results

Dark Blue Watershed Too Large – surface prep issue – sinks are being over filled, need a sink mask.

Small Blue Watershed Too Small – surface is correct, point is in the wrong place, move to the right.

Catch Basin (Drain) Issues

Catch Basin Points Must Be Moved

Conclusions

- Workflow is iterative
- Prepare the surface!
 - Prepare the surface
 - Prepare the surface
 - Prepare the surface

Lessons Learned

- **Stakeholder engagement**
 - Get them involved in QC
 - Expectations: goals and priorities
- **Process is iterative**
 - You don't just line it up and hit the "GO" button!
- **Not Perfect. But still FAR FAR better than field surveying method.**
